DETD . . . purified naive surface IgD+ human B cells in the presence of IL-4 or IL-13 (Table 7). Considerable levels of IgM, **IgG4**, total IgG and IgE, but no IgA were produced. There was no IgA production is compatible with previous observations which. . . Ig production. Inhibition of total IgG production by CD40Ig could not be measured, since the Ig portion of the CD40-Ig **fusion** protein gave a strong signal in the IgG ELISA. Interestingly, Ig production, including **IgG4** and IgE production, induced by IL-13 in the presence of COS-7/CD40L cells was not blocked by anti-IL-4 mAbs (10 .mu.g/ml),. . . 7). These results indicate that IL-13 induces Ig production independently from IL-4. These data furthermore indicate that IL-13 is another **cytokine** that directs naive surface IgD+ human B cells to switch to **IgG4** and IgE producing cells in the presence of a contact-mediated costimulatory signal delivered by COS-7 cells expressing the mouse or. . .

AB We report here the characterization of a novel Leishmania infantum **protein** termed papLe22 (22-kDa potentially aggravating **protein** of Leishmania). A positive clone from a cDNA library was identified by serum of a visceral leishmaniasis (VL) patient. Full-length cDNA obtained using rapid amplification of cDNA ends-PCR codes for a 22-kDa **protein**. In L. infantum promastigotes an endogenous nuclear **protein** of 14-kDa electrophoretic mobility was found by using an antiserum prepared against the **fusion protein** glutathione S-transferase-papLe22. Its expression was also shown in L. infantum amastigotes and in Leishmania major and Leishmania guyanensis promastigotes. VL patients' sera showed anti-papLe22 immunoglobulin M (IgM) and IgG reactivities, indicating that a primary response against the leishmanial **protein** papLe22 accompanied acute VL manifestations. Specific IgG levels were correlated with patients' clinical status. The presence of IgG1, **IgG2**, and IgG3 subclasses suggested a mixed Th1- and Th2-type response; there was no correlation between subclass reactivity and the disease course. The recombinant papLe22 specifically activated **interleukin**-10 production by VL patients' peripheral blood mononuclear cells collected at diagnosis and after treatment-induced cure, indicating its contribution to VL. . .
